## Mutually exclusive events

## Mutually Exclusive Event

Mutually exclusive events cannot occur as the same time.
For example, it is impossible to toss a coin and get a "head" and "tails", it is one or the other.

Figure 1
The Venn diagram for mutually exclusive events is shown above in figure 1.

Example 1
A fair six-sided die is rolled. Consider the following events
$\xi=\{1,2,3,4,5,6\}$
$A=\{$ spinning an odd number $\}$
$B=\{$ spinning a 6$\}$

$\operatorname{Pr}(A)=\frac{n(A)}{n(\xi)}=\frac{3}{6}=\frac{1}{2}$
Addition rule for mutually exclusive events
$\operatorname{Pr}(B)=\frac{n(B)}{n(\xi)}=\frac{1}{6}$
$\operatorname{Pr}(A$ or $B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)$ $\operatorname{Pr}(A \cup B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)$
$\operatorname{Pr}(A$ or $B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)=\frac{1}{2}+\frac{1}{6}$

$$
\operatorname{Pr}(A \cap B)=\mathbf{0}
$$

$$
=\frac{3}{6}+\frac{1}{6}=\frac{4}{6}=\frac{2}{3}
$$

$\operatorname{Pr}(A$ and $B)=0$
NB: When two events are mutually exclusive, it is impossible for both of them to occur at the same time.

## Not Mutually Exclusive Event

Events that are not mutually exclusive can occur at the same time.
For example, it is possible to roll a fair six-sided die and get an "even number" and "the number six".

Figure 2
The Venn diagram for an event that is not mutually exclusive is shown above in figure 2.

## Example 2

A deck of cards has 52 cards in total. Consider the following events
$\xi=\{52$ cards $\}$
$A=\{d r a w i n g ~ a ~ K i n g\} ~$
$B=\{$ drawing a Heart $\}$

$\operatorname{Pr}(A)=\frac{n(A)}{n(\xi)}=\frac{4}{52}=\frac{1}{13}$
$\operatorname{Pr}(B)=\frac{n(B)}{n(\xi)}=\frac{13}{52}=\frac{1}{4}$

## General addition rule for events

$$
\begin{gathered}
\operatorname{Pr}(A \text { or } B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)-\operatorname{Pr}(A \text { and } B) \\
\operatorname{Pr}(A \cup B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)-\operatorname{Pr}(A \cap B)
\end{gathered}
$$

$\operatorname{Pr}(A$ or $B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)-\operatorname{Pr}(A$ and $B)$
$\operatorname{Pr}(A \cup B)=\operatorname{Pr}(A)+\operatorname{Pr}(B)-\operatorname{Pr}(A \cap B)$

$$
\begin{aligned}
& =\frac{1}{13}+\frac{1}{4}-\frac{1}{52} \\
& =\frac{4}{52}+\frac{13}{52}-\frac{1}{52}=\frac{4}{13}
\end{aligned}
$$
